

Tutorial 09 - Expert Evaluation and User Testing

Before beginning, download the **Weekly UX Tasks 9 to 10 (UX Evaluation) word document template** from the Moodle Assessments section.

Revise week 9 content and complete the following in the downloaded document template as required. As this is an advanced unit, you are expected to solve exercise problems yourself, although the tutor is available for advice.

Part 1:

The Part 1 exercise relates to this week's content. It requires you to write about something *from your point of view*, and not to use generic results or images from generative AI. Generic discussions will be heavily reduced in marks.

Expert Review

- A student wants to use the Federation University Library website (<https://federation.edu.au/library>) to learn about how to write references and in-text citations correctly using APA 7th edition.
- **[300 words ± 30]** Use your current knowledge of best practices for UX usability regarding 1. Interaction Design, 2. Interface & Navigation Design, 3. Information Design, 4. Visual Design and 5. Nielsen's Ten Heuristics to perform an expert review for a user to achieve the goal above. Of course you cannot discuss everything in 300 words, so only focus on the key strengths, weaknesses and recommendations for these five criteria (e.g. For heuristics you may only discuss a couple heuristics that you feel needs attention).
- You will need to revisit guidelines and principles from:
 - Week 4 (Nielsen's Heuristics)
 - Week 5 (Interaction Design)
 - Week 6 (Interface and Navigation Design)
 - Week 7 (Information Design)
 - Week 8 (Visual Design)

Part 2:

Part 2 exercises relate to your major assignment. Revise the requirements and your scenario, complete the following:

a) Your Scenario

- **Take a screenshot of your entire scenario and paste it into your document.**

b) User Testing Methods

For your major assignment, you will be completing a cognitive walkthrough to help analyse and evaluate your high-fidelity clickable prototype to inform upon future design recommendations, but what if you had time for user testing?

Based on your assignment, complete the following:

- Imagine you had additional time to develop your prototype into a fully functional product almost ready to release to the public and could complete some user testing.
- Consider all of the different types of user testing methods discussed in the week 9 content.
- Research and **[300 words ± 30]** discuss **how** and **why** you would conduct this **one** type of user testing on your product before release.
- **Requirements:**
 - The discussion must be about a user testing method as identified in week 9 content.
 - You need to justify why you chose this type of user testing method.
 - You need to discuss how it would be used in the testing of your product, and how the testing would help you to release the product with the best possible user experience.
 - Include real APA 7th citations and references to support your discussion.

Due Date

Weekly UX Tasks 9 to 10 (UX Evaluation):

- Due Week 10 on Friday at 11:59pm.
- Worth 10% towards unit total.
- See the course description for information regarding late penalties and extensions.

Submission

Submit your **Word document** (based on the template provided) for the **Weekly UX Tasks 9 to 10** in the Assessments section of Moodle.

Marking

The marking rubric is available in the ITECH3001 Assessment Specifications document on Moodle.

Marks will be returned within 3 weeks of submission, ideally before submission of the major assignment.

Extensions

Without extension, late submissions will receive 5% penalty of the total marks available per day late. Marking will cease after 7 days late and be scored at zero. For further information regarding extension options and Special Consideration, please refer to the appropriate university resources:

- [Discretionary assessment extension](#)
- [Higher education special consideration - General](#)

All extension applications must be made through [My Student Centre](#) > Forms.

Academic Integrity

All document submissions will be processed through the Turnitin plagiarism detection system.

Any breach of academic integrity is considered a type of **academic misconduct** (or may be more than one type) and will be processed as academic misconduct. More information is available via

<https://www.federation.edu.au/students/wellbeing/student-advocacy/academic-misconduct/>

Breaches include (but are not limited to):

- Plagiarism
- Contract cheating
- Examination/test cheating
- Duplicate submission
- Fabrication
- Impersonation
- Academic Fraud
- Solicitation and promoting the breach of academic integrity
- Collusion
- Non-compliance with examination instructions/requirements
- Use of artificial intelligence to generate writing **unless** specifically indicated that it is allowed
- Text-spinners
- Use of techniques to disguise plagiarised work
