You can add more rows to each table below by clicking within the last cell of the table and then pushing “**Tab**” on your keyboard

Randomly Generated Scenario:

Your task this semester is to pitch, plan and develop a single scene for a game prototype with an **Exploration** theme.

It must be set in a 3D world, in a **Desert** environment, with one appropriate **2D GIMP texture that can be applied to your environment** created by yourself.

It must be set during **Night** time.

You are required to create two **Blender** 3D objects yourself, a **Park Bench** and an **additional static 3D object of your own choice** that suits your game scene.

The player/camera viewpoint should use a **Third Person camera**.

The player can approach another character and trigger an event with **Friendly** dialogue.

There should be additional events: a **Player Respawn** and an **Event of your own choice** (*must be different to your other events*). When triggered, each event should update the interface, such as displaying information, score, lives, etc.

Unity Store Assets: Assets that you have downloaded from the Unity Asset Store to use in your prototype

Asset Name: - eg: Medieval Gold	Type of Asset: - eg: 3D objects	Where it is used: - eg: Gold bars and coins to collect	URL (link) to the Asset on the Unity Asset Store: - eg: https://assetstore.unity.com/packages/3d/props/medieval-gold-14162
Amir(Main Character)	3D Character	The main character in the game	https://assetstore.unity.com/packages/3d/characters/humanoids/humans/low-poly-insurgent-228607
Water Bucket	3D Object	Used for character health increment	https://assetstore.unity.com/packages/vfx/shaders/water-drop-257945

NPC Character	3D Character	Used for NPC interaction	https://assetstore.unity.com/packages/3d/characters/humanoids/humans/adventure-female-free-272945

Did you use any online Tutorials? Details of the tutorial and what it helped you with

Details of what the tutorial helped you with - eg: Helped me learn about shooting mechanics and adapt for my player shooting	Tutorial URL: - eg: https://learn.unity.com/tutorial/let-s-try-shooting-with-raycasts

Major Changes made since submitting Prototype Plan: details of changes made and why it occurred

Change Made: - eg: Player Rabbit changed to Cat - eg: Removed complex Boss fight	Details of why this change occurred - eg: Could not find any rabbit models in the Unity Asset Store, so switched to a cat. - eg: Feedback for Part B indicated it was too ambitious, and to focus on simple combat only.

Known Bugs or Limitations: details of bugs you have identified but could not fix.

Limitations or Bugs: - eg: Player sometimes can move through the walls - eg: Shooting enemy not working	Details (how did you attempt to fix it?) - eg: Tried different colliders and many settings, but could not figure out why it was happening. If move slowly, the collision works. - eg: I set up raycasting on the Shoot.cs script, but it is not registering a hit on an enemy. Tried a couple of hours to fix it but failed.

The Player Controller: details of the controller that allows the player to control the avatar

Controller Asset Name: - eg: FPSController	Identify type of controller used: - Standard Assets Controller - Unity Asset Store Controller - Self-created Player Controller	Controller details: - eg: WASD to move around, SPACE to jump
Custom Player Controller	Self-created Player Controller	Uses WASD for movement

End Condition(s): details of the scripts/functions used to trigger End Condition(s) for the prototype

Type of End Condition:	Script that controls Condition:	End Condition details:
- eg: Win Prototype Level	- eg: WinGame.cs	- eg: Cross the finish line before the timer runs out to win. OnTriggerEnter function used to trigger condition at finish line if player enters trigger, timer stops and player is notified of winning on interface
- eg: Game over / Lose	- eg: PlayerController.cs	- eg: When player health reaches zero, a custom function GameOver will display "Game Over" on the screen.

Dialogue, Assigned, Own Choice Event (and any other Events you have added):

From your scenario, provide details of the scripts/functions used for your randomly generated Dialogue Event, Assigned Event, and Own Choice Event. *Example →*
If you have even more events, you can list them here as well.

The player can approach another character and trigger an event with <Dialogue Event> dialogue.

There should be additional events: <Assigned Event> and an <Own Choice Event>(must be different to your other events). When triggered, each event should update the interface, such as displaying information, score, lives, etc.

Event type and name:	Script	Object with Script	Event details:
- eg: Assigned: Opening Object	- eg: DoorTrigger.cs	- eg: DoorTrigger	- eg: During Update function, checks if "E" was pressed AND Player is in trigger area. If both TRUE, then door opens. OnTriggerEnter function used to test if the Player is in the trigger area.
- eg: Dialogue: Angry	- eg: AngryTrigger.cs	- eg: AngryNPC	- eg: OnTriggerEnter checks if player in Trigger area near NPC. If TRUE, then text appears, "You shouldn't be in the graveyard! Turn around now or my minions will ATTACK YOU!".
- eg: Own Choice: Attack	- eg: Attack.cs	- eg: Sword (child object of PlayerController)	- eg: During Update function, system checks to see if "Left mouse button" was pressed. If TRUE, then the player sword swings forward. OnCollisionEnter calculates damage if contact is made.
